Advanced Programming

Exam 2018

Silvan Robert Adrian

November 5, 2018

Contents

1 Question 1.1: Utility functions

The Code for this task is attached in the appendix A.1.

1.1 Version

2 Question 1.2: Parsing appm databases

2.1 Choice of parser library

I implemented the Parser for appm in parsec, mostly out of this reason:

- Better Error handling compared to ReadP
- I do have more experience with Parsec then ReadP

2.2 Transform Grammar

The existing grammar has some ambiguities, like allowing many names, version etc. which now transformed to only allow once

```
Database ::= \epsilon
```

3 Earls of Ravnica

The code for this task can be found in Appendix

3.1 Solution

3.2 Implementation

The earls of Ravnica can be seen as a state machine for which I chose to use gen_statem. The following states exist:

- Under Configuration
- Active
- Shutting down

3.3 Data Structure

The Data structure I used to implement Ravnica consists of a map with following entries:

- **description** Saves the description which gets saved when starting a server
- **connections** Map for Handling the connections from one District to an other
- **creatures** Map for handling all the entered/active creatures on a Server

3.4 All states

3.5 Under configuration

3.6 Active

3.7 Shutting down

3.8 Territories with cycle

A Code Listing

A.1 Question 1.1: handin/appm/src/Utils.hs

```haskell
module Utils where

-- Any auxiliary code to be shared by Parser, Solver, or tests
-- should be placed here.

import Defs

instance Ord Version where
  (<=) (V[]) _ = False
  (<=) (V(_:_)) (V []) = True
  (<=) (V[VN v1int v1str])  (V[VN v2int v2str]) =
    if checkVersion v1int v2int v1str v2str then True else False
  (<=) (V(VN _ _:xs))  (V(VN _ _:ys)) = V(xs) <= V(ys)

checkVersion :: Int -> Int -> String -> String -> Bool
checkVersion a b c d = a <= b && (c <= d || length(c) <= length(d))

```

```
merge :: Constrs -> Constrs -> Maybe Constrs
merge [] [] = Just []
merge c1 [] = Just c1
merge [] c2 = Just c2
-- merge ((pname1,(bool1, miv1, mxv1)):xs) ((pname2,(bool2,
↪  miv2,mxv2)):ys) =
--                                                              if miv1 <=
↪  (miv2 <= mxv1)  then
--                                                                   if miv1
↪  <= (mxv1 <= mxv2) then
--
↪  Just [(pname2, (bool1,miv1, mxv2))]
--                                                                   else
--
↪  Nothing
--                                                              else
--
↪  Nothing
merge (c1) (c2) = Just (c1 ++ c2)
```

A.2 Question 2.1: handin/ravnica/district.erl

```
-module(district).
-behaviour(gen_statem).
-export([create/1,
         get_description/1,
         connect/3,
         activate/1,
         options/1,
         enter/2,
         take_action/3,
         shutdown/2,
         trigger/2]).
%% Gen_statem callbacks
-export([terminate/3, code_change/4, init/1, callback_mode/0]).
%State Functions
-export([under_configuration/3, active/3]).
-type passage() :: pid().
-type creature_ref() :: reference().
-type creature_stats() :: map().
-type creature() :: {creature_ref(), creature_stats()}.
-type trigger() :: fun((entering | leaving, creature(), [creature()])
                                                    -> {creature(),
                                                    ↪  [creature()]}).

-spec create(string()) -> {ok, passage()} | {error, any()}.
